

Texas SB 820 - TEST PLAN

Testing FileSure.Cloud for malware protection is straight forward and leverages it's free one-month trial.

1. Download our [pseudo-ransomware](#) program.
 - Notice that the download worked. There is no need to run the program
2. Delete the program file that you just downloaded (It was only a test download)
3. Setup an account at <https://filesure.cloud>
 - This will require an email address and making up a password
 - Email alerts and reports will be sent to this email address
 - On the configuration screen, turn on all the malware rules and click 'Save configuration'
4. Pick a typical user's computer and install the FileSure.cloud agent
 - <https://www.bystorm.com/binaries/webinstall.exe> is the direct download link
 - Or just go to <https://filesure.cloud> and use the 'Get installer' button.
 - Use the same email address as in Step 3 to install the agent
5. Wait about 15 minutes for the agent to pull down the rules from the cloud
6. Repeat step 1 and download and run our [pseudo-ransomware](#) program
 - Notice that this time **the download failed**

The only thing that changed was the installation of FileSure.cloud and its configuration to block writing of program files.

7. Try it out with your normal business processes and verify that everything works correctly.
Since FileSure.cloud will be preventing program files from being written to the hard drive, it's possible that it will interfere with how some program typically operate. Notably programs written in Java
